LP · 10.0%

RETURNS

Common Equity LP IRR	5.60%
Income 6.50% · Apprec +4.00%/yr · Leverage -4.91%	
LP MOIC	1.32x
GP IRR	273.22%
GP MOIC	97.03x
Equity Profit (LP+GP)	\$1.57M
LP Total Receipts	\$4.68M
GP Total Receipts	\$343K

FINANCING & ASSUMPTIONS

Total Cost	\$10.00M
Bank Loan (65% LTC)	\$6.50M
⚠ RECURSE LOAN — Personal guarantee in effect · Burns off: At Certificate of Occupancy	
Construction Period	24 mo @ 7.50% (constr. rate)
Perm Loan (54% LTV)	\$6.89M @ 5.75%
Refinance	Month 30 (user-defined)
Extension Window (Mo 24–30)	8.50% capitalizing (constr. 7.50% +1.00% spread)
Extension Fee (1.00%)	\$71K — capitalized at Month 24
Mezz Loan (Total LTC 80%)	\$1.50M @ 12.00%
Preferred Equity (Structured Capital)	\$1.00M @ 9.00%
LP Equity (Common)	\$3.44M
GP Equity (Common)	\$3K
Hold Period	7.0 yrs (2.0yr constr + 5.0yr ops)
Lease Ramp	ON — 9 mo from 0% → 92% occ.
Stabilized NOI	\$651K/yr
Exit Cap Rate (Target)	5.50% (on Exit NOI \$704K)
Implied Cap Rate (memo)	5.08% (on Stabilized Yr-1 NOI \$651K)
NOI Growth (2.00%/yr) compounds actual ops cash flow every year from Year 2 on — it drives distributions, DSCR, mezz/pref coverage, the Pro Forma, and the CSV, not just the exit figure. Exit NOI above is a separate forward-priced number (Trailing T-12 basis), so it won't match any single ops-year's NOI elsewhere in this report. Only DSCR-at-stabilization, auto-sized reserves, and the sensitivity matrix stay pinned to the flat Stabilized Yr-1 NOI shown here.	
Gross Sale Price	\$12.80M

DEAL STRUCTURE

Preferred Return (Promote Hurdle)	8.00%
GP Mgmt Fee	1.50%/yr on LP equity — \$340K lifetime total
LP / GP Promote (T1 base)	80% / 20%
T2 (>9.0% IRR)	70% / 30%
T3 (>12.0% IRR)	60% / 40%
Loan Draw Schedule	S-Curve
Interest Methodology: Calculated monthly on actual draws. S-Curve schedule = logistic front-weighted funding over 24 months → \$635K total construction interest.	
Capital Draw Schedule	S-Curve
COST BREAKDOWN	
Land	15.0%
Hard Cost	65.0%
Soft Cost	15.0%
Contingency	5.0%

RISK & COVERAGE

DSCR (P&I basis)	1.25x
Net DSCR (Agency — net of Repl. Reserve)	1.06x
DS — P&I (DSCR basis)	\$520K/yr
DS — I/O (first 24 mo)	\$396K/yr
Stabilized YOC	6.50%
Stabilized NOI Yield on Equity	18.87%
Bridge Risk	No
Capital Call (LP + GP)	⚠ \$2.38M
→ Refi Shortfall	\$2.29M
→ Repl. Reserve Cap Calls (LP)	\$88K
→ Repl. Reserve Cap Calls (GP)	\$88
LP/GP split pro-rata by equity share — GP's figure is small because GP holds 0.1% of common equity, not a rounding error.	
Stabilized DSCR / LP IRR	1.25x / 5.60%

Chronological Cash Flow

① CONSTRUCTION LOAN

Bank Principal	\$6.50M	50.8%
Construction Interest (capitalized)	\$635K	5.0%
Total Construction Claim	\$7.14M	55.7%

② REFI AT COMPLETION

Perm Loan Funded	\$6.89M	53.8%
Refi Transaction Cost	(\$69K)	-0.5%

LP IRR Sensitivity (Blended Bank Rate × Exit Cap Rate) — full model at actual deal settings; highlighted cell (yellow border) = actual inputs = headline IRR

Exit Distribution — Where \$12.80M Goes

Gross Sale: **\$12.80M** → Net Sale Pool: **\$12.67M** (after \$128K disposition cost)

Senior Repaid		Pref Eq Redeem	LP ROC	LP Pref
Recipient	Amount	% of Net Sale Pool (\$12.67M)		
Senior Repaid	\$6.56M	51.8%		
Pref Eq Redeemed	\$1.20M	9.4%		
GP Mgmt Fee	\$236K	1.9%		
LP ROC	\$3.53M	27.9%		
GP ROC	\$4K	0.0%		
LP Pref	\$1.14M	9.0%		
Total Distributed	\$12.67M	100.0%		

LP Cash-on-Cash by Year (Pre-exit distributions, incl. refi close)

No interim LP distributions — all return at exit.

Exit Distribution — Sankey Flow

Sankey shows exit waterfall distributions. Waterfall priority: Disposition Cost → Senior → Mezz → Pref Equity → Mgmt Fee → LP/GP ROC → LP/GP Pref → GP Catchup → Promote. Percentages are % of Net Sale Pool (\$12.67M) — same basis as the "% of Net Sale Pool" column in the table below. Disposition cost \$128K shown as a leakage item; net pool after it = \$12.67M. LP/GP Promote = \$0 at exit: no residual remained after senior waterfall tiers.

LEGAL DISCLAIMER. CREDevSim is a financial modeling tool for analytical purposes only. Nothing herein constitutes investment, legal, or tax advice. All outputs — including IRR, MOIC, NOI, waterfall distributions, and loan sizing — are mathematical estimates derived from user-supplied assumptions and do not represent guaranteed or expected results. Results are highly sensitive to inputs and may differ materially from actual outcomes. This tool does not compute tax obligations, depreciation recapture, capital gains treatment, opportunity zone elections, or any other tax or legal liability; all figures are pre-tax estimates unless stated otherwise. Outputs have not been audited or certified by any third party and must be independently verified before presentation to investors, lenders, partners, or regulators. The user bears sole responsibility for all inputs and outputs. Development Deal Performance & Returns Report — Exhibits

Exit distribution · LP cash flows · Deal analytics · Generated 2026-07-21 16:08

Refi Distribution — Where the Loan Proceeds Go

Sankey shows the refinance event: perm loan proceeds (+ capital call, if any) and where they land. Shortfall — capital call funds the gap; no further distribution until operations catch it up.

NOI Distribution — Where Cumulative NOI Goes

Sankey shows cumulative operating-period NOI and where it goes before any sale event. Δ Red segment (\$88K) = equity capital calls from LP + GP: months where DS + TI/LC + Repl.Rsv exceeded operating NOI.

LEGAL DISCLAIMER. CREDevSim is a financial modeling tool for analytical purposes only. Nothing herein constitutes investment, legal, or tax advice. All outputs — including IRR, MOIC, NOI, waterfall distributions, and loan sizing — are mathematical estimates derived from user-supplied assumptions and do not represent guaranteed or expected results. All values in this report are derived from the formulas below. The model applies institutional-grade CRE waterfall mechanics: senior debt priority → management fee → return of capital (pari passu) → preferred return → GP catchup → promote split. IRR is computed via Newton-Raphson iteration on monthly LP cash flows. No shortcuts, approximations, or hard-coded returns are used. Investors and auditors may reproduce any figure by applying these formulas to the inputs shown on pages 1–2.

PERFORMANCE METRICS

LP IRR	$\text{Newton-Raphson: } r \text{ s.t. } \sum (CF_t / (1+r)^t) = 0$	Monthly compounding on LP net cash flows $t=0 \dots \text{exit}$
LP MOIC	$\text{Total LP Distributions} \div \text{LP Equity Invested}$	Includes ROC + Pref + Promote + GP Clawback received
GP IRR	Same Newton-Raphson on GP net cash flows	$GP\ CF = \text{Mgmt Fee} + \text{ROC} + \text{Pref} + \text{Catchup} + \text{Promote}$ (all GP inflows; Mgmt Fee is GP compensation, not a deduction)
GP MOIC	$\text{Total GP Distributions} \div \text{GP Equity Invested}$	
Equity Profit	$(\text{Total LP} + \text{Total GP}) - (\text{LP Equity} + \text{GP Equity})$	Profit above total equity invested
DSCR	$\text{Stabilized NOI} \div \text{Annual Debt Service}$ (P&I basis when the loan amortizes; I/O only for whole-life-IO loans)	Computed at perm loan stabilization; 0 if no debt
Stabilized YOC	$\text{Stabilized NOI} \div \text{Total Project Cost}$	Unlevered yield on full cost basis
Stabilized NOI Yield on Equity	$\text{Stabilized NOI} \div (\text{LP Equity} + \text{GP Equity})$	Levered NOI yield on equity deployed
Exit Price	$\text{Stabilized NOI} \div \text{Exit Cap Rate}$	Implied sale price before disposition costs

DEBT & LOAN MECHANICS

Construction Loan	$\text{Total Cost} \times \text{LTC}\%$	Loan-to-Cost — applied to selected cost basis
Constr. Interest	Distressed/Bridge: $\text{Loan} \times \text{Draw Factor} \times \text{Rate} \times \text{Period (yrs)}$. Development/Renovation: monthly balance-accrual simulation (capitalizing)	Distressed/Bridge Draw Factor (closed-form input): Lump=1.0, Linear=0.50, S-Curve≈0.55. For Development/Renovation, the Draw Factor shown elsewhere is a derived avg-balance statistic (owed interest ÷ (Loan × Rate × Period)), not a calculation input — draw timing is simulated month-by-month
Bank Total Claim	$\text{Constr. Loan} + \text{Capitalized Interest}$	Retires at refi or exit
Perm Loan (LTV)	$\text{Exit Price} \times \text{LTV}\%$	Loan-to-Value sizing
Perm Loan (DY)	$\text{Stabilized NOI} \div \text{Min Debt Yield}\%$	Debt Yield constraint
Perm Loan (DSCR)	$\text{Stabilized NOI} \div (\text{DSCR}_{\text{min}} \times \text{Perm Rate})$	DSCR constraint
Binding Constraint	$\min(\text{LTV}, \text{DY}, \text{DSCR}) \text{ loan size}$	Most restrictive sizing wins (Pro)
DS — I/O Phase	$\text{Perm Loan} \times \text{Perm Rate} \div 12 \text{ per month}$	Interest-only; no principal reduction
DS — P&I Phase	$\text{Loan} \times [i(1+i)^n \div ((1+i)^n - 1)]$	i = monthly rate; n = amort months
Refi Net Proceeds	$\text{Perm Loan} - \text{Const. Claim} - \text{Refi Fee} - \text{Reserve}$	Positive = surplus for distribution

OPERATING PERIOD CASH FLOWS

Monthly NOI	$\text{Stabilized NOI} \div 12$ (Year 1 basis)	Ramp-up applies S-curve if enabled (see below); if NOI Growth is on, this figure escalates annually starting Year 2 — see Model Scope & Stated Assumptions
Monthly DS	$\text{Annual Debt Service} \div 12$	I/O or P&I per loan phase
NOI Pool / mo	$\text{Monthly NOI} - \text{Monthly DS}$	Available for waterfall distributions
Mgmt Fee / mo	$\text{LP Equity} \times \text{Mgmt Fee Rate\%} \div 12$	Annual AUM-based fee (not NOI-based); deducted from NOI pool monthly
Mezz Interest / mo	$\text{Mezz Balance} \times \text{Mezz Rate\%} \div 12$	Paid from NOI after senior DS; coverage-capped — unpaid portion accrues to balance (PIK)
Pref Eq Coupon / mo	$\text{Pref Contribution} \times \text{Coupon\%} \div 12$	Paid after mezz DS; coverage-capped with PIK accrual; redeemed at refi/exit ahead of common equity
Pref Accrual / mo	$(\text{Unreturned Capital} + \text{Prior-Period Unpaid Pref}) \times \text{Rate} \div 12$	Compound: unpaid pref earns interest-on-interest. Compound base refreshes monthly.
Pref Paid / mo	$\min(\text{NOI after Mgmt, Pref Accrued \& Unpaid})$	Pref paid pari passu LP/GP by equity %
Ops Residual / mo	$\text{NOI after Mgmt \& Pref (if any surplus)}$	Split LP/GP at promote %
Lease Ramp NOI(t)	$\text{NOI} \times \text{occ}(t) \div \text{Stabilized_Occ}$	$\text{occ}(t)$ = S-curve from current→stabilized over ramp months
S-Curve Occ(t)	$\text{Occ_curr} + (\text{Occ_stab}-\text{Occ_curr}) \times \sigma((t-\text{mid})\div\text{scale})$	σ = logistic function; mid = ramp_months÷2

EQUITY DISTRIBUTION — PRIORITY ORDER

#	Recipient	Formula / Amount	Notes
1	Senior Debt	Bank Principal + Accrued Interest	First lien; always paid before equity
1b	Mezzanine Debt	$\text{Balance} \times 12.00\%/yr$; PIK when NOI (after senior DS) can't cover	Second lien; interest paid after senior DS; principal + accrued repaid at refi/exit before all equity
1c	Preferred Equity	$\text{Contribution} \times 9.00\%/yr$ coupon; PIK when uncovered	Priority equity; coupon after mezz DS, redemption at refi/exit ahead of all common equity
2	GP Mgmt Fee	$\text{LP Equity} \times 1.50\%/yr$ (monthly accrual)	Asset management fee; deducted from NOI pool monthly before distributions
3	LP ROC	$\text{LP Equity Invested} (100\%)$	Return of contributed LP capital; pari passu with GP ROC
4	GP ROC	$\text{GP Equity Invested} (100\%)$	Return of contributed GP capital
5	LP Pref	$(\text{Unreturned LP Capital} + \text{Unpaid LP Pref}) \times 8.00\% \div 12$ / mo	Compound pref (monthly): interest-on-interest on unpaid balance. Paid from NOI during ops, residual at exit.
6	GP Pref	$(\text{Unreturned GP Capital} + \text{Unpaid GP Pref}) \times 8.00\% \div 12$ / mo	Pari passu with LP pref by equity %
7	GP Catchup	$\text{Target} = \text{LP Pref Paid} \times (\text{GP\%} \div \text{LP\%})$	Catches GP to proportional share of total pref pool
8	Promote Split	T1: 80%LP/20%GP · T2 (>9.0% IRR): 70%LP/30%GP · T3 (>12.0% IRR): 60%LP/40%GP	Multi-tier: hurdle measured by IRR; each tier applies to residual above its threshold
↩	GP Clawback	$\min(\text{GP Prior Promote}, \text{LP Pref Shortfall})$	GP returns prior promote if LP pref was short at exit (Pro)

NOI ADJUSTMENTS & OPERATING RESERVES

Replacement Reserve (annual)	$\$100K/yr \rightarrow$ deducted post-DS	Post-stabilization Replacement Reserve modeled as a cash deduction, not a segregated reserve account. \$0 during lease ramp-up (TI already in construction budget). No return at exit. Allow Deferral is OFF — shortfall months trigger an equity capital call (\$88K total). LP + GP inject the deficit.
Net Distributable Cash (NDC)	$\max(\text{NOI} - \text{DS} - \text{TI/LC} - \text{Repl.Rsv}, 0)$	Distributable cash floored at \$0/month before waterfall allocations.

EXIT & SALE MECHANICS

Gross Sale Price	Exit NOI ÷ Exit Cap Rate	Exit NOI = flat Yr-1 NOI, or escalated terminal NOI if NOI Growth is enabled — see Model Scope & Stated Assumptions table
Net Sale Price	Gross Sale - (Gross × Disposition Cost%)	Pool available for waterfall; Gross = Net if cost = 0
Pref Due at Exit	LP/GP Equity × Pref Rate × Hold Years - Pref Paid Pre-Exit	Remaining pref obligation settled from sale proceeds
Exit Bank Claim	Perm Balance at Exit + Accrued Exit Interest	P&I amort reduces balance if amort active
Perm Balance	Loan × (1+i)^k - Pmt × [(1+i)^k-1] ÷ i	k = months elapsed in P&I phase; 0 if I/O only
GP Clawback	max(LP_Pref_Due - LP_Pref_Paid, 0)	Shortfall triggers; capped at GP promote received
Equity Profit	LP Total + GP Total - LP Equity - GP Equity	Net profit to equity investors combined

MODEL SCOPE & STATED ASSUMPTIONS

NOI Growth	Ops: Year-1 NOI \$651K, growing 2.00%/yr from Year 2 (5.0 ops yrs). Exit (Trailing T-12): \$651K × (1+2.00%)^4.0 = \$704K → ÷ cap	Ops cash flow (distributions, DSCR after Year 1, mezz/pref coverage) grows at this same rate every year starting Year 2 — see Annual Pro Forma. Exit NOI is a separate forward-pricing figure, not a repeat of any single ops-year NOI. Only DSCR-at-stabilization, auto-sizing reserves, and the sensitivity matrix use the flat Year-1 NOI.
Interest Accrual	Compound preferred return (monthly)	Unpaid pref earns interest-on-interest; accrues monthly; paid as NOI allows
Equity Timing	LP + GP equity deployed via S-curve over 24-month construction/bridge period	Capital draw schedule governs LP/GP equity deployment timing
After-Tax Scope	Asset-level tax only; not investor K-1 or fund-level	PAL limits, AMT, NIIT, state taxes not modeled
Draw Factors	Distressed/Bridge: Linear = 0.50, S-Curve ≈ 0.55 (closed-form multiplier)	Development/Renovation deals instead run a real monthly balance-accrual simulation; the Draw Factor shown for those is a derived reporting statistic (avg balance ÷ loan), not a model input
1031 Exchange	Perfect deferral: exit tax = \$0 if elected	Structural/timing rules (45-day ID) not enforced
Mid-Hold Capex	\$100K/yr deducted monthly from distributable NOI before waterfall (total: \$500K over 5.0 yr ops)	Reduces LP/GP distributions each operating year. Modeled as consumed capex (not a segregated reserve account).

AFTER-TAX CALCULATION (WHEN ENABLED)

Building Basis	(Total Cost + Cap. Constr. Interest) × Building %	\$263A: constr. interest capitalizes for dev/reno; Building % from cost breakdown or user input
Land Basis	(Total Cost + Cap. Constr. Interest) × Land %	Land never depreciates; retains full basis at exit
Annual Depreciation	Building Basis ÷ Useful Life (or bonus-dep avg)	27.5 yr residential · 39 yr commercial · Bonus methods front-load via ~20% eligible Y1
Accum. Depreciation	Annual Depr. × Hold Years	Reduces building basis at exit; capped at building basis
Total Adjusted Basis	Land Basis + (Building Basis - Accum. Dep.)	Full tax basis including non-depreciable land
Recapture Tax	Accum. Depreciation × Recapture Rate (25%)	Unrecaptured \$1250 gain taxed as ordinary
Taxable Cap Gain	Total Gain - Recapture Amount	Gain above total adjusted basis less recapture
Cap Gain Tax	Taxable Cap Gain × LTCG Rate	Long-term rate if hold > 1 year
Total Exit Tax	Recapture Tax + Cap Gain Tax	Deducted from LP proceeds before after-tax IRR
After-Tax IRR	Newton-Raphson on LP CFs with exit tax deducted	Asset-level; not investor K-1 allocation
1031 Exchange	Exit Tax → \$0 (perfect deferral)	Ignores 45-day ID / 180-day close rules

Audit Verification. Every figure on pages 1–2 can be independently replicated by applying the formulas above to the deal inputs. The IRR is computed via monthly Newton-Raphson iteration (tolerance 1×10⁻⁸) on the full monthly LP cash flow array — no simplified annual approximations. GP Promote Clawback (when enabled) is applied as a closing adjustment before final LP/GP totals are recorded. **Tier Consistency Check: PASSED.** Every enabled promote tier that should have received proceeds, given this deal's cumulative LP distributions, did. No tier was skipped while residual remained available and LP had not yet cleared that tier's hurdle. **Limitations:** This is a pro-forma projection, not an audit. Actual results depend on market conditions, operating performance, lender terms, and tax treatment. All inputs were user-supplied; this tool does not verify their accuracy. Users should engage qualified legal, accounting, and financial advisors before presenting projections to investors.

Development Deal Performance & Returns Report — Appendix B: Deal Proof Sheet

Every calculation with actual deal values substituted · Generated 2026-07-21 16:08

This page replicates every figure from the summary by substituting actual deal values into each formula. Read left-to-right: item name · how it was computed (with real numbers) · the result. Every result on pages 1–2 traces back to a row on this page.

CAPITAL STRUCTURE

Total Project Cost	User input	\$10.00M
Senior Loan	$\$10.00M \times 65.0\% \text{ LTC}$	\$6.50M
Mezzanine Loan	Total LTC 80.0% ceiling – senior; 12.00% rate, current pay (sized to ceiling, not the manually-entered Mezz Amount)	\$1.50M
Preferred Equity (Structured Capital)	9.00% coupon, current pay; redeemed at exit before common equity	\$1.00M
Common Equity Required (Cost Basis)	Total Cost – Senior – Mezz – Pref Eq = $\$10.00M - \$6.50M - \$1.50M - \$1.00M$	\$1.00M
+ Day-0 Financing Costs (Equity-Funded)	Rate cap + loan origination fee(s) added to equity basis	\$155K
+ Capital Calls (Refinance Shortfall)	Additional common equity called after closing — see Risk & Coverage	\$2.29M
Total Equity Capitalized	Cost Basis + Day-0 Fees + Capital Calls = $\$1.00M + \$155K + \$2.29M$	\$3.45M
LP Equity	$\$3.45M \times 99.9\%$	\$3.44M
GP Equity	$\$3.45M \times 0.1\%$	\$3K

CONSTRUCTION LOAN & CARRY

Draw Factor	S-Curve≈0.55	0.62
Construction Int.	Monthly balance-accrual simulation (capitalizing) — 0.62 Draw Factor shown below is the resulting avg-balance ratio, not a calculation input	\$635K
Total Bank Claim	$\$6.50M + \$635K$	\$7.14M

PERMANENT LOAN

Perm Loan (LTV)	$\$12.80M \times 53.8\% \text{ LTV}$	\$6.89M
Perm Fee	$\$6.89M \times 1.00\%$	\$69K
Annual DS — I/O phase (24 mo)	$\$6.89M \times 5.75\% \text{ (interest only)}$	\$396K/yr
Annual DS — P&I phase (after I/O)	$\$6.89M \times 7.5493\% \text{ annual constant (25-yr amort)}$	\$520K/yr
DSCR (P&I basis)	$\$651K \div \$520K \text{ (P\&I DS)}$	1.25x

REFI EVENT — PERM LOAN FUNDING

GP Mgmt Fee (refi)	Construction arrears settled from refi proceeds	—
LP Pref (refi)	Construction arrears settled from refi proceeds	—
GP Pref (refi)	Construction arrears settled from refi proceeds	—
LP ROC (refi)	Equity returned from refi proceeds	—
GP ROC (refi)	Equity returned from refi proceeds	—
GP Catchup (refi)	None at refi	—
LP Residual (refi)	T1 (80% split): \$0 · T2 (>9.0% IRR): \$0	—
GP Promote (refi)	T1 (20% split): \$0 · T2 (>9.0% IRR): \$0	—

EXIT PRICING & SALE

Stabilized NOI	User input	\$651K/yr
Exit Cap Rate (Target)	User-set via slider (0.25% increments) — applied as-is, not back-derived	5.500%
Exit NOI (Trailing T-12)	$\$651K \times (1+2.00\%)^4$ over 5.0 ops yrs — ops cash flow escalates at this same rate every year starting Year 2 (see Annual Pro Forma), this is a separate forward-pricing figure, not a flat-NOI exit	\$704K
Gross Sale Price	$\$704K + 5.500\% \text{ (Exit NOI + cap rate)}$	\$12.80M
Stabilized YOC	$\$651K + \$10.00M$	6.50%
Stabilized NOI Yield on Equity	$\$651K \div \$3.45M$	18.87%
Disposition Cost	$\$12.80M \times 1.00\%$	\$128K
Net Sale Price	$\$12.80M - \$128K$	\$12.67M

EXIT WATERFALL — FROM SALE PROCEEDS

① Bank Principal	$\$6.89M \text{ perm loan} - \$333K \text{ principal paydown (25-yr amort} \times 5.0\text{-yr ops)} = \$6.56M \text{ at exit}$	\$6.56M
① Bank Interest	Accrued at exit (if any unpaid)	Paid from ops
② GP Mgmt Fee	Remaining mgmt obligation at exit	\$236K
③ LP ROC	LP equity + ops capital calls (Repl.Rsv call \$88K)	\$3.53M
③ GP ROC	GP equity + ops capital calls (Repl.Rsv call \$88)	\$4K
④ LP Pref (exit)	Remaining after ops/refi paid \$0	\$1.14M
④ GP Pref (exit)	Remaining after ops paid \$0	\$0
LP Pref Shortfall	8.00% pref owed but not funded	Δ \$1.24M
⑤ GP Catchup (exit)	None at exit	—
⑥ LP Residual (exit)	T1 (80% split): \$0 · T2 (>9.0% IRR): \$0	\$0

GP Clawback	Not triggered	—

OPERATING PERIOD (5.0 YRS)

Stabilized NOI	User input	\$651K/yr
Monthly NOI	$\$651K \div 12$	\$54K/mo
Monthly DS	$\$419K \div 12$	\$35K/mo
NOI Pool / mo	$\$54K - \$35K$	\$19K/mo
DS Funding Source	How DS was funded across ops period	Fully from NOI
OS Reserve Status	Restricted cash withheld at refi for DS coverage	— (none funded)
LP Pref Accrual/mo	$(LP\ capital + unpaid\ LP\ pref) \times 8.00\% \div 12$ — compound monthly (starts at \$3.44M)	\$23K/mo (at stabilization)
GP Pref Accrual/mo	$(GP\ capital + unpaid\ GP\ pref) \times 8.00\% \div 12$ — compound monthly (starts at \$3K)	\$23/mo (at stabilization)
LP Pref Paid (ops)	From NOI over 5.0 yrs	\$0
GP Pref Paid (ops)	From NOI over 5.0 yrs	\$0
LP ROC (ops)	Equity return from NOI before promote	—
GP ROC (ops)	Equity return from NOI before promote	—
GP Catchup (ops)	Fully settled at exit	—
LP Residual (ops)	$T1\ (80\%\ split): \$0 \cdot T2\ (>9.0\%\ IRR): \0	—
GP Promote (ops)	$T1\ (20\%\ split): \$0 \cdot T2\ (>9.0\%\ IRR): \0	—
GP Mgmt Fee (ops)	Constr. carry: $\$3.44M \times 1.50\% \times 2.00\ yrs = \$103K$ + Ops: $\$3.44M \times 1.50\% \times 5.0\ yrs = \$258K \rightarrow$ Full-hold static entitlement (reference only, ignores NOI-coverage timing/caps): \$362K. Actual fee funded from ops NOI this period (right column) — paid from ops NOI	\$104K
LP TI/LC Cap Calls (ops)	LP share of TI/LC (+ replacement reserve if applicable) shortfalls — non-deferrable, equity-funded	—
LP Repl.Rsv Cap Calls (ops)	LP share of Repl. Reserve shortfalls — only when Allow Deferral is OFF	\$88K
GP TI/LC Cap Calls (ops)	GP share of TI/LC shortfalls	—
GP Repl.Rsv Cap Calls (ops)	GP share of Repl. Reserve shortfalls — only when Allow Deferral is OFF	\$88

RETURN SUMMARY

LP ROC	Capital returned (refi + ops + exit; exit ROC includes TI/LC cap calls \$0 + Repl.Rsv cap calls \$88K)	\$3.53M
LP Total Pref	Accrued \$2.38M (8.00% on declining balance, 7.0 yrs) · Paid \$1.14M · Δ Short \$1.24M — unfunded pref, not a capital call	\$1.14M
LP Total Promote	Ops + Refi + Exit	\$0
LP Total	$\$3.53M + \$1.14M + \$0$	\$4.68M
GP Total	Mgmt Fee + ROC + Pref + Catchup + Promote – Clawback	\$343K
Equity Profit	$(\$4.68M + \$343K) - \$3.45M$	\$1.57M
LP MOIC	$\$4.68M \div (\$3.44M\ base + Repl.Rsv\ call\ \$88K)$	1.32x
LP IRR	Newton-Raphson on monthly LP CFs (cap call months are outflows)	5.60%
GP MOIC	$\$343K \div (\$3K\ base + Repl.Rsv\ call\ \$88)$	97.03x
GP IRR	Newton-Raphson on monthly GP CFs	273.22%
